SENSING PRACTICES

If you were to outline a diagram of how an air pollution sensor interacts with an environment it would look something like this: air passing across a chemical membrane or being drawn into an optical sensor either forms a chemical reaction, in the case of the membrane, or is passed across an infra-red beam and counted for numbers of particles in the case of an optical sensor. These sensory readings and reactions cause voltages in electrical circuits to fluctuate, generating signals that in turn can be converted into digital output to be read as data in the form of parts per million of the particular pollutant being sensed. Yet such a sensor might also be used as part of specific environmental monitoring undertaken by a concerned citizen in order to document potentially harmful levels of pollution from industry or roadways. The unit of sense – the seemingly discrete organ or object through which sensing would occur – becomes entangled as another entity and set of relations in the making through the specific sensing practices under way.

This example of an air pollution sensor deployed for citizen sensing practices is just one of many possible examples of the ways in which sensing and units of sense begin to shift toward what we are calling ‘sensing practices’ (Gabrys 2012b; Pritchard 2013). Sensing practices refer to the ways in which sensing and practice emerge, take hold and form attachments across environmental, material, political and aesthetic concerns, subjects and milieus (cf. Stengers 2011b). From sensors used for environmental monitoring to collaborations with lichens to understand air pollution, as well as smart infrastructures that sense and adjust to real-time conditions, the registers and practices of sensing are shifting from an assumed human-centred set of perceiving and decoding practices, to extended entities, technologies and environments of sense. New registers of sense are becoming evident as organisms express different and dynamic ways in which environments are changing. And many of these shifts and extended registers of sense are further captured through ubiquitous computing that distributes sensing capacities across environments. Citizen sensing also constitutes a set of sensing practices that is meant to enable and empower people to sense for political effect, giving rise to questions about the politics of sense, and how sensing entities transform into agents of provocation and change (Cuff and Hansen 2008; Goodchild 2007).

While we focus on citizen sensing in order to develop this notion of sensing practices, many other practices could be drawn together to elaborate this concept, from trans-material and racialized experiences of lead poisoning (Chen 2012), to digital simulation environments for battlefield preparation (Suchman and Weber 2016), to insect-plant couplings forming particular ecologies of sense (cf. Braidotti...
With these developments in mind, how might it be possible to rethink and rework the practices, entities and environments of sense within this broader context where the assumed subjects and trajectories of sense are shifting? How might these expanded approaches to sensing practices recast engagements with experience, while reconfiguring explorations of practice-based research (Citizen Sense 2014–15)?

Rather than take ‘the senses’ as a fixed starting point, we suggest that sensing-as-practice allows for an attention to these different articulations of sense, particularly in relation to technologies of environmental monitoring, data gathered for evidentiary claims, the formation of citizens, and more-than-human entanglements. Sensing-as-practice also allows for an attention to experience that does not concentrate exclusively on a human subject, but instead accounts for a vast range of sensing subjects, from stones to insects (cf. Whitehead 1929). William James, a philosopher who influenced Whitehead, suggests that a moment of experience ‘proliferates into the next [moment] through transitions which, whether conjunctive or disjunctive, continue the experiential tissue’ (1996: 87).

Sensing practices then shift attention to formations and processes of experience across multiple entities within particular milieus (cf. Gabrys 2012a).

By approaching sensing differently, not as the senses or as a human point of mediation, it is possible to begin to account for the ways in which sensing practices resonate with particular entities and relations. Sensing is not a project of a human mind or organs decoding external substantialist phenomena, as Whitehead would suggest, but rather could be understood as the ways in which experience is expressed through subjects. Yet this is also a collaborative undertaking, and so ‘collaborative sensing’ (Gabrys 2016a) is always a key aspect of sensing practices. Far removed from the Cartesian brain in a vat, here collaborative sensing refers to the ways in which shared worlds are felt, sustained and even created (cf. TallBear 2011). If we were to return to the air pollution sensor discussed at the beginning of this entry, we would find that the initial delineation of a sensor detecting stimuli and converting those stimuli into data is a rather linear and limited configuration of the sensing work that goes on with this technoscientific device. Sensors do not merely capture environmental data, but rather they are involved in collaborative sensing practices for parsing environments.
and environmental problems, as well as organizing approaches for how to take action and generate political responses through particular forms of environmental citizenship.

Sensing practices are then differently materialized in relation to the subjects and entities, milieus and environments, processes and situations involved in experiencing. Distinct affective and political capacities are operationalized through sensing practices, where the use of an air pollution sensor by a citizen sets in motion a much different political trajectory than a forest damaged by smog. Sensing practices are ways of articulating what matters, of signalling an expressive register of relevance, and affecting and being affected. In this respect, sensing practices are world-making practices (cf. Stengers 2011a). They are ways of ‘meeting in a world shared in common’ (James 1996: 79). This common world is not so much a place where entities agree to show up, but rather is a milieu among a diversity of milieus that is actively made through shared inhabitations and experiences.

Jennifer Gabrys and Helen Pritchard

Socially just pedagogies have grown out of a critical or radical pedagogies movement, including pedagogical practices informed by Marxist, feminist and critical race theory which encouraged a critique of political, social, economic and sociocultural issues in education, whilst foregrounding the importance of transgressive transformation of the educational project. The critical pedagogies literature has largely focused on what Freire (1972) referred to as ‘humanising pedagogy’ through democratic and sociocultural practices which focus on inequalities and power relations and the importance of economic, cultural and political participatory parity (Fraser 2008). Socially just pedagogies examine who has access to education, what sort of knowledges are valued and devalued, and whose voices are prominent in education. While acknowledging the important contributions that these humanist perspectives have had on socially just pedagogies, a critical posthuman perspective builds on this tradition, but also brings different foci to socially just pedagogies.

Posthumanism provides a number of productive and generative ways of considering socially just pedagogies. Rosi Braidotti (2013), Karen Barad (2007, 2015) and Donna Haraway’s (2008) works are particularly pertinent in thinking about how posthumanism may contribute to imagining socially just pedagogies, as they all express a deep concern for social justice and socially just practices. Braidotti’s (2013) notion of moving beyond critical deconstruction and critique to alternative enactments of becoming, where power is not only seen as limiting but also as affirm- ative, has particular relevance for socially just pedagogies. This provides the impetus for rethinking learning as a creative and indeterminate process rather than one which has as its objective acquisition fixed bodies of knowledge. Furthermore, Braidotti’s (2013) embodied and embedded nomadic subject illuminates the potentialities and becomings in learning environments, where experimentation in education gives rise to unforeseen but productive and inventive processes rather than predetermined outcomes. Creativity is not an inherent property of individuals,
